

Sustaining Growth: Soil Fertility Management in Tropical Smallholdings

This volume is the revised English translation of the German title, *Bodenfruchtbarkeit und Standortgerechte Landwirtschaft*. It presents a range of practices conducive to sustainable agricultures, and is of particular importance for the development of smallholdings in the tropics. These include agroforestry, intensive fallowing and green manuring, the use of mulch, compost, stable manure, and not least, the purposeful use of natural symbionts. The aim of all of these practices is the maintenance of soil fertility using a minimum of external inputs. Much ancient knowledge related to these practices have been forgotten over the years. They are re-examined here, in the light of recent research findings.

Sustaining growth: soil fertility management in tropical smallholdings [1994]. Mueller-Saemann, K.M. Technical Centre for Agricultural and Rural Cooperation, plant growth response to fertilization as related to the amount of nutrient extracted. . helpful tools used in devising sustainable nutrient management strategies is the Many tropical soils have a naturally limited supply of nutrients Nutrients removed via harvesting of some field crops in small holdings (Mueller-Samana.
